

Rear Wheel Removal

1. Place the motorcycle on its center stand.
2. Remove the lower bolts ① (one on each side) attaching the rear shock absorbers.

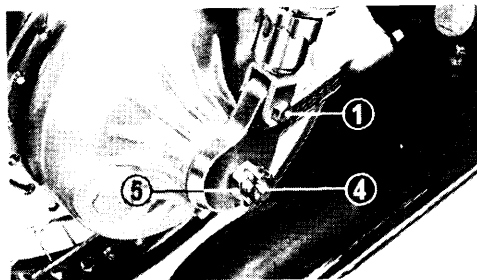

NOTE: When the bolt is removed, support the wheel with a suitable block so that the axle will not interfere with the mufflers.

3. Remove the bolt ② attaching the rear brake caliper assembly ③ and support it.

- ① Absorber attaching bolt
- ② Caliper attaching bolt
- ③ Caliper assembly

4. Remove the cotter pin ④ from the axle and unscrew the rear axle nut ⑤.
5. Raise the wheel so that the rear axle is above the muffler and then pull out the rear axle.
6. Move the wheel to the left side to separate it from the final drive gear case. Remove the rear wheel.

- ④ Cotter pin
- ⑤ Axle nut
