

## PRECAUTIONS BEFORE RIDING

Observe the following precautions:

- When crossing a stream or when riding in a deep puddle, have the ends of the crankcase breather pipe and carburetor flow pipe raised up to the level of seat. At the end of riding, water should be drained from the carburetor float chamber.
- Adjust the rear shock absorber ① according to road or riding condition. Position I is for light loads and smooth road conditions. Positions II to V progressively increase spring tension for stiffer rear suspension, and are used when the motorcycle is heavily laden or operated in rough terrain.
- Take care not to block air cleaner suction port. This will result in poor engine performance.
